

The lab-frame halo changes the spectrum's normalisation, its endpoint and its shape — and the sign of the normalisation change depends on the mediator

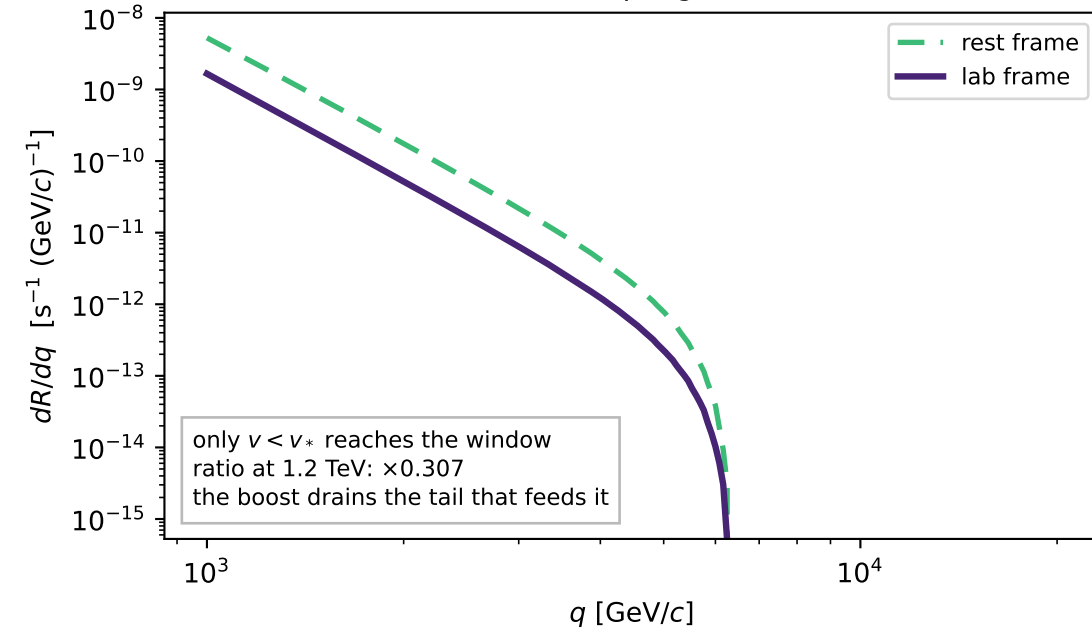

A. Massless, bulk coupling ($\alpha_n = 10^{-3}$)

B. The ratio: a plateau set by the mediator, then the endpoint

C. Massless, near the coupling floor ($\alpha_n = 2.5 \times 10^{-9}$)

D. $\lambda = 200 \mu\text{m}$, bulk coupling
